

# Mobile payments

Auriga ePayment has developed a customer-adapted style sheet /css) which works on all small terminals and mobile devices that support XHTML 1.0. This allows you to make payments wherever you happen to be, simply by connecting to the Internet from your handset. The difference from paying by SMS is that the money is debited straight away, and nothing is charged subsequently, for instance on your mobile phone bill.

The image shows the payment page with a style sheet that we have developed specifically for mobile terminals.

## *In practice*

*Provided you have a mobile device that supports XHTML 1.0 you can, for instance, buy tickets or pay for your parking by connecting to the Internet. This way you avoid having to pay anything later, on your next bill. Or perhaps you are going fishing and notice upon arriving that you need a fishing license. You can then quickly connect to the Internet, pay for your license and continue fishing legally and in peace and quiet.*

## *Auriga*

*Many people associate the name Auriga with service and security - the hallmarks of our payment transaction services. This, therefore, is a natural choice of name now that we are a part of the Nordic region's leading payment service provider. Our services for e-commerce payments is called Auriga ePayment.*
